```
a protein having a molecular weight of 180 kD in a dimeric form as determined by SDS-PAGE, where each subunit of the dimeric form as a molecular weight of 97 kD as determined by SDS-PAGE, and where the enzyme cleaves precursor alpha2-antiplesmin at the Pro12-Asn13 bond. The enzyme inhibitors of the enzyme and methods for detecting such inhibitors are useful for treating conditions involving fibrin, e.g. inflammatory conditions such as all forms of arthritis, organ fibrosis, undesirable scarring, cancer or its metastases, or atherothrombotic disease such as cronary artery thromboses, attroke, pulmonary embolism, all other forms of arterial and venous thromboses. This peptide corresponds to the N-terminal sequence of the alpha2-antiplasmin cleaving enzyme.
                                                                                                                                                                                                                                                                                                                                       The invention relates to an alpha2-antiplasmin cleaving enzyme comprising
                                                                                                                                                                  New alpha-2-antiplasmin cleaving enzyme, useful for treating conditions involving fibrin, e.g. inflammatory conditions such all forms of

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.

Example 1.4; SEQ ID NO 19; 177pp; English.

The method further comprises administering to the subject a second agent.

The method further comprises administering to the subject a second agent.

The second agent is an anti-inflammatory agent, immunosuppressant, or

anti-infective agent such as antibacterial, antiviral, antifungal, anti
controlled anti-inflammatory agent, immunosuppressant, or

anti-infective agent such as antibacterial, antiviral, antifungal, anti
controlled agent such as antibacterial, antiviral, antifungal, anti
controlled anti-inflammatory agent. The FAP alpha dimer enzyme is a truncation.

The FAP alpha dimer enzyme. The FAP alpha dimer enzyme is a truncation.

Controlled monomer. The FAP alpha dimer enzyme comprises an anino acid

conbstitution relative to wild type FAP alpha dimer. The amino acid

conbstitution relative to wild type FAP alpha dimer. The amino acid

constitution relative to wild type FAP alpha dimer. The amino acid

constitution relative to wild type FAP alpha dimer. The amino acid

condition, abnormal immune response selected from inflammation,

crejection, toxic shock syndrome, allergy, asthma, atherosclerosis,

cresponse is subsequent to an infection, such as an RSV infection. Immune disease, selected from inflammation and antifection, such as an RSV infection. acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha diner enzyme comprising an antho acid substitution of A657D; and a composition comprising a FAP alpha diner enzyme lacking amino acids 269-448 and comprising amino acids 269-448 from mouse FAP. The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically autoimmune disease is selected from c, autoimmune thyroiditis, systemic lupus erythematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves disease, myssthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the N-terminal 50 amino acids of human wild type FAP.

(first entry) 21-JAN-1998 Human fibroblast activation protein-alpha (FAP-alpha)..

Fibroblast activation protein-alpha; FAP-alpha; human; 

```
This sequence represents the dimeric fibroblast activation protein alpha (FAP-alpha). The FAP-alpha molecule is capable of degrading extracellular matrix proteins and exhibite structural features typical of type II integral membrane proteins, including a large COOH-terminal extracellular domain, a hydrophobic transmembrane segment and a short cytoplasmic tail. The putative extracellular domain is described as containing five potential N-glycosylation sites, eleven conserved cysteine residues and three segments corresponding to highly conserved cysteine residues and three segments corresponding to highly conserved catalytic domains characteristic of serine proteases. Most common types of epithelial cancers including breast, ulug, skin, pancreas and colorectal carcinomas contain abundant FAP-alpha reactive stronal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and carcinogenesis is consistent with its putative role in normal fibroblast physiology. FAP alpha inhibitors, particularly a collagen derivative or (S)-valyl-pyrrolidine-2(R)-boronic acid, may be used to treat various epithelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the amino acid sequence of FAP-alpha

This sequence represents a dimeric fibroblast activation protein alpha (FAP-alpha) which is capable of degrading extracellular matrix proteins. The FAP-alpha molecule exhibite structural features typical of type II integral membrane proteins, including a large COM-terminal extracellular chambrane proteins, including a large COM-terminal extracellular common types of epithelial cancers including breast, lung, skin, pancreas and colorectal carcinomas contain abundant FAP-alpha reactive stromal fibroblasts which accompany tumour blood vessels. The induction of FAP-alpha fibroblasts at times and sites of tissue remodelling during fetal development, tissue repair and carcinogenesis is consistent with the putative role in normal fibroblast physiology. FAP alpha inhibitors, particularly a collagen derivative or (8)-valyl-pyrrolidine-2(R)-boronic scid, may be used to treat various epithelial cancers, e.g. breast, lung, skin, pancreas or colon cancer. Note: This sequence differs from the main acid sequence of FAP-alpha found in AAW31963 between residues 625

The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS034 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is a fallicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glatt K, Hoersh S, Kamatkar S;

This invention relates to a method of differentially modulating the CC growth or differentiation of blood endothelial cells (BEC) comprising an agent that differential cells with a candothelial cells with a composition comprising an agent that differentially modulates blood or composition comprising an agent that differentially modulates blood or Ivmphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that the LEC protein is not VEGFR-1; and administering to the subject a composition composition composition allowed and polymuclecides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, or visotropic or antimifiammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphoedema, in screening for an endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells, in manufacturing a medicament for the disorder or in monitoring the efficacy or toxicity of a drug on endothelial cells. The agent is useful in manufacturing a cell or lymphatic vessel endothelial cell growth or differential in coll growth or differential cell growth as medicament of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as the treatment of collect diseases involving the lymphatic vessels, warious inflammatory diseases and cancer metastasis via the lymphatic cyptem. The superior of a human LEC/BEC differentially cells when an experient or the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual dand a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarche indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic act sequences may be useful in diagnostic and screaming applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                       soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

polypeptide, or may lack the associated signal peptide, or may comprise an extracellular domain with or without its associated signal peptide, or may be any of these fused to a heterologous polypeptide such as an entrope tag, or the Fc region of an immunoglobulin. TAT polypeptides of the invention, and their encoding nucleic acids, provide targets for the
                                                New Tumor-associated Antigenic Target polypeptides useful for diagnosing, preventing or treating cell proliferative disorders such as cancer or
                                                                                                                                                                                                          The present sequence is that of novel tumor-associated antigenic target polypeptide TAT430. TAT polypeptides have been identified ADM14770-ADM14776 whose expression is upregulated in particular tumor tissues. Tissue expression profiling using GeneExpress indicated that TAT430 is upregulated in breast, pancreatic, colon, adrenal, bladder, kidney, liver, lung, lymphoid, ovarian, prostate and stomach tumor stroma as compared to the corresponding healthy tissues. Upregulation in ovarian tumor tissue was confirmed by quantitative analysis of TAT mRNA expression, and upregulation in breast, pancreatic, colon, adrenal and bladder tumors was confirmed by gene expression profiling in silico (GEPIS) analysis. The TAT polypeptide may comprise the full-length
                                                                                                                                                             Claim 1; SEQ ID NO 13; 141pp; English

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Jesson MI; Disclosure; SEQ ID NO 2; 177pp; English. Miller GT, (POIN-) POINT THERAPEUTICS INC. 09-JAN-2004; 2004US-0535577P. Jones B, WPI; 2005-564220/57. N-PSDB; AEB94158. dclean PA,

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation by protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the flective to down-regulate an immune response. Also included are the flecks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition comprising a FAP alpha dimer enzyme la subject a second agent. The method further comprises administering to the subject a second agent. The second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such an anti-infectial, antiviral, antifungal, anti-infective agent such an anti-infectial, antiviral, antifungal, anti-infective agent such antibacterial agent. The FAP alpha dimer enzyme is a truncation anti-infective comparise is a fusion or chimmer protein. The TAP alpha dimer enzyme is a truncation anti-infective to wild type FAP alpha dimer. The FAP alpha dimer enzyme is a substitution relative to wild type FAP alpha dimer. The amino acid substitution is present in the beta-propeller domain, the catalytic domain, or an N-linked glycosylation site and altered disulfide bond formation. The immune response is an especially and remainded formation, and the personner and an especial formation. The formation and an response is subsequent to an infection, such as an RSV infection. The autoimmune disease is selected from c, autoimmune thyroiditis, systemic lupus erythematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, Crohn's disease, Guillain-Barre's syndrome, psortiasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to acid sequence of human autoimmune disease, sepsis, graft versus host disease, transplant rejection, toxic shock syndrome, allergy, asthma, atherosclerosis, osteoarthritis, and Guillain-Barre's syndrome. The abnormal immune cancer. The present sequence represents the amino acid sec wild type fibroblast activation protein (FAP) alpha dimer

Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.

Claim 134; SEQ ID NO 61; 177pp; English.

The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibrobiast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable composition comprising a FAP alpha dimer enzyme in an amino acid substitution of A657D; and a composition comprising a FAP alpha dimer enzyme lacking amino acides 269-448 and composition comprising a FAP alpha dimer enzyme lacking an inti-infective agent such as antibacterial, immunosuppressant, anti-infective agent such as antibacterial, antifungal, and parasitic or anti-mycobacterial agent. The FAP alpha dimer enzyme is a heart of a FAP alpha dimer enzyme is a heart of a FAP alpha dimer. The amino acid substitution is present in the becapropaler domain, the catalytic domain, or an N-linked glycosylation site and alters disliked bond condition, abnormal immune response selected from inflammation, autoimmune disease, sepals, graft versus host disease, transplant condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response is an especially and alters deceeded condition, autoimmune disease, sepals, graft versus host disease, transplant condition, and substitution substitution substite and multiple, systemic condition, toxic shock syndrome, altery, asthma, atheroaclerosis,

comprising a raw alpna anner enzyme comprising an amino acida substitution cof A657D, and a composition comprising a rape alpha dimer enzyme lacking amino acida 269-448 and comprising amino acida 269-448 from mouse FAP.

The method further comprises administering to the subject a second agent.

The second agent is an anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-parasitic or anti-mycobacterial agent. The FAP alpha dimer enzyme is a truncation type FAP alpha dimer enzyme is a truncation cutton. The FAP alpha dimer enzyme is a truncation cutton relative to wild type FAP alpha dimer. The antimo acid substitution relative to wild type FAP alpha dimer. The amino acid substitution relative to wild type FAP alpha dimer. The amino acid substitution is present in the beta-propeller domain, the catalytic domain, or an N-linked glycosylation site and alters disulfide bond formation. The immune response is an especially an IL-I mediated condition, abnormal immune response is elected from inflammation.

Condition, abnormal immune response selected from inflammation, crancion. The immune disease, sepsis, graft versue host disease, transplant craft formation is osteoarthritis, and Guillain-Barre's syndrome. The abnormal immune creponse is subsequent to an infection, such as an RSV infection. Crohn's disease, Guillain-Barre's syndrome. The abnormal immune creponse (Grohn's disease, Guillain-Barre's syndrome, pasoriasis, Theumatic fever, Crohn's disease, Guillain-Barre's syndrome, pasoriasis, Graves' disease, guillain-Barre's syndrome, pasoriasis, Graves' disease, guillain-Barre's syndrome, pasoriasis, Graves' disease, guillain-Barre's syndrome, pasoriasis, The subject does not have cancer or a predisposition to cancer. The present sequence represents the N-terminal 50 amino acids of comprising a FAP alpha dimer enzyme comprising an amino acid substitution mouse wild type FAP

```
The invention relates to a method of down-regulating an immune response, which comprises administering to a subject a fibroblast activation which comprises administering to a subject a fibroblast activation protein (FAP) alpha dimer enzyme in a mount effective to down-regulate an immune response. Also included are the following: a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, where the composition is sterile and lacks an adjuvant; a composition comprising a FAP alpha dimer enzyme in a pharmaceutically acceptable carrier, and a non-adjuvant second agent; a composition of A657D; and a composition comprising a FAP alpha dimer enzyme lacking amino acids 269-448 and comprising amino acids 269-448 from mouse FAP.

CC A657D; and a composition comprising an amino acids adjustive accord agent is a mati-inflammatory agent, immunosuppressant, or anti-infective agent such as anti-inflammatory agent, immunosuppressant, or anti-infective agent such as antibacterial, antiviral, antifungal, anti-infective agent such as a pagent is a truncation current of parasitic or anti-invocation at the FAP alpha dimer enzyme is a fusion or chimeric procein. The FAP alpha dimer enzyme is a fusion or chimeric procein, and parasitic or substitution is present in the beta-propeller domain, the catalytic condition, abnormal immune response is an especially an IL-I mediated condition, abnormal immune response selected from inflammation. The response is subscited from inflammation is antered agent of subscited from inflamme disease, seaples, graft versue as an RSV infection. The response is allowed as an RSV 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              autoimmune disease is selected from c, autoimmune thyroiditis, systemic lupus erythematosus (SLE), uveitis, hemolytic anemias, rheumatic fever, Crohn's disease, Guillain-Barre's syndrome, psoriasis, Graves' disease, myasthenia gravis, glomerulonephritis, autoimmune hepatitis and multiple sclerosis. The subject does not have cancer or a predisposition to cancer. The present sequence represents the amino acid sequence of mouse wild type fibroblast activation protein (FAP) alpha dimer.
                                                                                                                                                                                                                                                                                                                            Down-regulating an immune response comprises administering to a subject in need a fibroblast activation protein (FAP) alpha dimer enzyme in an amount effective to down-regulate an immune response.
                                                                                                                                                                                        Jesson MI;

                                                                                                                                                                                                                                                                                                                                                                             This sequence represents human sperm protein 45. The protein has a molecular weight of 45 kD, and has 27% identity and 45% homology over a 268 amino acid stretch with an Ensis minor male gonad nuclear protein (GenBank accession number L181814). The invention relates to human sperm protein 45 (AAB97649), nucleic acids encoding it (AAH46211), and a method for the recombinant production of the protein. The present invention additionally discloses an antagonist of sperm protein 45 for therapeutic use, and an antibody which specifically binds to operm protein 45. Sperm protein 45, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene or activity of a protein associated with malignant neoplasia. The method is useful for prediction, diagnosis or prognosis of malignant neoplasia cauch as breast cancer, ossophageal cancer, wesenchymal cancer, bladder cancer or non-small cell ung cancer. The polymucleotides and polymethides cancer or non-small cell specification, antisense polymucleotides targeting either one of the polymucleotides or polypeptides, antibodies targeting either one of the polymucleotides or polypeptides, and compounds identified by the screening methods are useful for preferably breast cancer. The present sequence is that of a human preferably breast cancer. The present sequence is that of a human malignant neoplasia-related protein which may be used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of predicting response to cancer treatment comprising detection of at least 2 markers, where the markers are genes and fragments or genomic nucleic acid sequences that are located on one chromosomal region, which is altered in malignant neoplasia. The invention also relates to a method for the prediction, diagnosis or prognosis of malignant neoplasia, methods for detecting deregulations in malignant neoplasia and breast cancer, a method of determining the phenotype of a cell or tissue, a method for identifying genomic regions which are altered on the chromosomal level and encode genomic neoplasia and breast cancer, methods of screening for agents which regulate the activity of a polypeptide or a polymucleotide and malignant neoplasia and breast cancer, methods of screening for agents which regulate the activity of a polypeptide or a polymucleotide and polypeptide. The method is useful for predicting response to cancer treatment. The methods and compositions are useful for predicting diagnosing, preventing or treating malignant neoplasia, and preventing or treating malignant encorated and cancer, mesenchymal cancer, pastric cancer or non-small-cell concerned the inventional polypeptide used in the cancer of the inventional polypeptide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host calls, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for plant has been expession in a plant cell, and to identify a homolog or polynucleotide expression in a plant cell, and to identify a homolog or or tholog to an abiotic stress responsive polynucleotide. The nucleic acid or holog to an abiotic stress responsive polynucleotide. The nucleic acid cresponsiveness of a plant to an abiotic stress, such as cold stress, sait stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                              New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by each acrea and sorders include SAPHO syndrome (synovitis, acne, pustubosis, hypercosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne valgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention olypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by chis patent did not form part of the printed specification, but was this patent did not form the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                    Propionibacterium acnes polypeptides and nucleic acide useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Maisonneuve JL;

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

concoding a Propionibacterium acnes protein. The invention also relates to polymeptides encoded by the polymucleotides (ABMS5624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a colymucleotide of the invention; antibodies against polypeptides of the invention; polymeptide of the invention; and an isolated T cell population comprising T cells prepared to invention; and an isolated T cell population comprising T cells prepared to polymeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymeptide); a method and kit cfor detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a conference or patient. The P. acnes polypeptides, polymeptides, polyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotific condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield;
or for stimulating an immune response specific for a P. acnes protein.

The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, heabicides, extreme camporing plant tolerance to cold, heat, drought, heabicides, extreme camporing plant tolerance to cold, heat, drought, herbicides, extreme camporing pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing gladactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one arress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert properties that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                        New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a prointeration of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
cenceding a polypeptide whose expression is inhibited by the antisense
comucleic acid; (4) an antibody capable of specifically binding
the polypeptide of its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
cc proliferation or the activity of a gene in an operon required for
proliferation; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
cc proliferation, or that inhibits proliferation of an
capanism acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
cc product is overexpressed or underexpressed; (12) determining the extent
ct o which each of the strains is present in a culture or collection of
ct o which each of the strains is present in a culture or collection of
cstrains; or (13) identifying the tearget of a compound that inhibits the
cc proliferation of an organism. The antisense nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids required
for proliferation to isolate candidate molecules for rational
drug discovery programs, or for screening homologous nucleic acids
cellular proliferation to isolate candidate molecules for rational
drug discovery programs, or for screening sequence is encoded by one of
the target prokaryotic essential genes. Note: The sequence data for this
content of format directly from MIPO at
                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       directly from WIPO at

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypoptides (AAM38642-AAM42213) with nootropic, concoded polypoptides (AAM38642-AAM42213) with nootropic, concoded polypoptides are useful immunosuppressant and cytostatic activity. The polymuclectides are useful confidence in gene therapy. A composition containing a polypoptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous as system diseases, such as localised neuropathy and contral nervous system diseases, such as lateral sclerosis, and central nervous system diseases, such as a lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activity, cancer simmune system suppression, call thrombolytic activity, cancer diagnosis and therapy, drug screening, cassays for receptor activity, arthritis and inflammation. leukaemias and control states. Note: The sequence data for this patent did not form control to the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein identification, signal transduction pathway, metabolic pathway; hybridisation assay, genetic mapping, gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of UT156897 protein, which is encoded by an mRNA species that is differentially expressed in human benign prostatic hyperplasia (BPH) tissue compared to normal human tissue. J156897 cDNA (see AA171055) was obtained from a placental CDNA library following identification of differentially expressed BPH mRNA. Up-regulation of JT156897 is diagnostic of BPH in symptomatic patients. Since BPH with symptomatic patients. Since BPH with gymptoms is associated with hypertrophic growth of the prostate and/or a low grade chronic inflammatory response, up-regulation of JT156897 bNA. Or of protein products derived from it, is likely to be of diagnostic cyalue in disease states involving inflammatory responses or hypertrophic growth in tissues in which JT156897 is found (e.g. breast and cervix). A claimed method of diagnosing a disease involves determining the level of expression of a JT156897 is found (e.g. breast and cervix). A claimed method of diagnosing a disease involves determining the level of expression of a JT156897 is found (e.g. breast and cervix). A claimed method of diagnosing a disease involves determining partners. Dominant negative proteins, DNAs encoding these proteins, antibodies to these proteins, peptide fragments or mimics may be introduced into cells to affect function. The protein also provides novel targets for the screening of synthetic small molecules and combinatorial or naturally-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel JT460914 and JT156897 polypeptides associated with Benign Prostatic Hyperplasia, useful as a diagnostic agent or marker of Benign Prostatic Hyperplasia and other hyperplastic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral scleroals; SNy-brager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;

The genes of the invention are designated protein 608, oCP or CMP608. The OCP polymucleotide and polypeptide sequences are useful for preventing treating or controlling osteoporosis, bone fractures, bone elongation osteoporal and osteoporal sequences are useful for preventing, on the present in the present sequence involving mechanical stress in a subject. The present sequence represents human addican-2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated mechanical stress induced polynucleotide, useful for diagnosis, treatment, prevention or control of osteoporosis, osteopenia, osteopetrosis, osteosethritis, periodontitis, bone
The present sequence is the protein sequence for AT4G10590, a ubiquitin-
specific C-terminal hydrolyzing protease. AT4G10590 can be used for
regulating pseudo-arabis protein degradation. The function of the
AT4G10590 gene is closely related to the development, differentiation am
programmed cell death (apoptosis) of plant cells, signal transduction and
cell period regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a composition comprising an isolated mechanical stress induced polypeptide identified as adlican or its functional portion or a polypeptide which is at least homologous or identical to it, and a physiologically acceptable excipient. Also included are an anticadican antibody or composition containing it, a composition comprising an isolated nucleic acid molecule encoding adlican and a physiologically acceptable excipient and a composition comprising a vector that comprising a ceptable excipient and a physiologically acceptable excipient and a physiologically acceptable excipient. The compositions and antibody are useful for preventing, treating or controlling osceoporosis, or for fracture healing, bone elongation, osteopenia, periodontosis, low bone density, osteopetrosis, osteoperisis, low bone density, osteopetrosis, cateoscierosis, osteopetrosis, cateoscierosis, osteopetrosis, low bone density, osteopetrosis, cateoscierosis, cateosci
                                                                                                                         Human, OCP, osteoclast protein, osteoporosis; osteopenia; osteopetrosis; osteoscierosis; osteoarthritis; periodontosis; bone fracture;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated mechanical stress induced polypeptide useful for preventing, treating or controlling osteoporosis, bone elongation, osteopenia, periodontitis, low bone density or for fracture healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  53.9%; Score 41; DB 5; Length 2828; 35.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of genes associated with mechanical stress, and the proteins encoded by them. The genes of the provention are designated protein 608, oCP or CMF608. The OCP polymucleotide and polypeptide sequences are useful for preventing, treating or controlling osteoporosis, bone fractures, bone elongation osteopomia, osteopomia, osteopomis, osteopomis, osteopomis, osteopomis, periodomitis, only bone and ansity or other conditions involving mechanical stress in a subject. The present sequence represents human adlican protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated mechanical stress induced polynucleotide, useful for diagnosis, treatment, prevention or control of osteoporosis, osteopenia, osteopetrosis, osteosclerosis, osteosarthritis, periodontitis, bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical corporated responses in a cell, tissue, organ or organism.

Cor physicological responses in a cell, tissue, organ or organism.

Cor diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic seaves and furthermore in the treatment of human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids.

The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune disorders, alterating or preventing diseases such as inflammation, autoimmune disorders, alterating or preventing diseases such as inflammation, autoimmune disorders, alterating or preventing diseases such as inflammation, autoimmune companience, anthritis, Alzheimer's disease, infections, stroke, muscular dystrophy arthritis, nephrotropic, antiarthitic, happitorpolic, antialing muchanience, antiarthitic, happitorpolic, antiarthitic, happitorp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism.

CC or physiological responses in a cell, tissue, organ or organism.

CC diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids.

The NOVX polypeptides, polynuclectides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosals, cancer and diabetes. Purthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune of sisorders, allergies, blood disorders, equired immunodeficiency syndrome of sorders, allergies, blood disorders, acquired immunodeficiency syndrome of sorders, allergies, blood disorders, stroke, muscular dystrophy arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antidiabetic, antiarteriosclerotic, antiallergic, antiarteriosclerotic, antiallergic, antiarteriosclerotic, antiallergic, antiarteriosclerotic, antiarteriosclerotic, antiarteriosclerotic, antiarteriosclerotic, antiarteriosclerotic, antiarterior crelaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, crelating and angiogenesis. The nucleic acids are also neurogenesis. Wound healing and angiogenesis. The nucleic acids are also the angent and anticonnyments and anticonnyments. This polypeptide is a homologue of a human NOVX protein of the constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the presence of breast cancer in an individual, involves using specific polynucleotide markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape

Lung cancer associated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for
                               The invention comprises a method for assessing whether a patient is afflicted with breast cancer or ovarian cancer. The method involves the use of specific DNA markers. The method of the invention is useful in the detection and treatment of ovarian and breast cancer. Amino acid sequences ABJ37025 - ABJ37080 represent human breast/ovarian cancer-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.

inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administerating a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma bronchiectasis. The genes, polynucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences ABUS6408-ABUS6745 represent lung cancer-associated polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Breast cancer diagnosis or treatment by comparing the level of expression of a marker in a patient sample with that in the control non-breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               patient sample and the normal level is an indication that the patient is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glatt K, Hoersh S, Kamatkar S;

  cancer associated sequences from
afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
